## Introduction to Cloud & laaS

Watched video

### Setup a Server on DigitalOcean

- Watched video
- Demo executed
  - ☐ Created a DigitalOcean account (Free Tier)
  - Created a Droplet
  - ☐ Configured Firewall rule to open port 22 for your IP address
  - Connected to Droplet
  - ☐ Installed Java on Droplet

### **Deploy Application on Droplet**

- Watched video
- Demo executed
  - Built Jar File with gradle
  - Copied to remote Server (Droplet)
  - ☐ Run App on Droplet
  - ☐ Configured Firewall Rule to open port 7071 to access App via browser

### **Useful Links:**

• You can clone this project: <a href="https://github.com/pmendelski/java-react-example">https://github.com/pmendelski/java-react-example</a>

### Video - Create a Linux User

- Watched video
- Demo executed
  - Added User
  - ☐ Added new User to sudo group
  - Created .ssh folder with ssh key for new User

# More Resources...

# **Best practices**

- Security: Open ports only for specific IP addresses or ranges (Sources in Sources in Sources)
- **Security**: Do NOT use Root User. Create a new Linux user for every application and give it only the permission it needs to run that application.
